

Let us exceed your expectations

The MaxxSeal Difference

MaxxSeal is an environmentally safe, high molecular weight acrylic co-polymer. **MaxxSeal** products are manufactured by our company using extremely controlled and highly scrutinized batch processing. Each batch is evaluated before, during and after completion to assure that we are producing the highest grade polymers possible for dust control and soil stabilization. We follow ISO standards to the point that every tote that leaves our facility can be traced back to each process. All test and analysis documents, associated with each batch, can be retrieved.

Before each batch process begins we evaluate the compositional products to assure that they are within our specifications. This is often accomplished by taking a sample of the product and injecting it into a Gas Chromatograph (GC) to verify quality. The quality of the compositional products that we use ensures us that we will be delivering the safest strongest polymers for soil stabilization and dust control projects.

During the production process we use various in-line analyses, such as measuring the exothermal temperature change, to verify that the reaction is moving along as expected. This helps to assure that the end product is a high quality high molecular weight polymer.

Once the polymerization process is completed we then test the end product to assure that that all our specifications are met and that there has been a complete reaction yielding the anticipated results. We will test for consistent particle sizes, residuals, percentage of solids, pH levels, viscosity, weight per gallon, etc. We will then run a Fourier Transform Infrared Spectroscopy Analysis (FTIR) on that batch. Tests for each batch produced are documented and cataloged. These tests are always available to the customer for verification of composition and quality. Each batch will then receive a verified certificate of analysis and safety data sheet specific to that batch.

Let us exceed your expectations

The MaxxSeal Difference

Our Customers

With **MaxxSeal** products you are getting the safest highest quality polymer possible for dust control and soil stabilization. This product is a virgin top grade polymer that undergoes strict benchmark testing in every step of the production process. The high molecular weight of this polymer gives it the unsurpassed strength, durability, stability and a level of safety that our customers have come to expect.

For years we have supplied high quality environmentally safe polymers to some of the largest companies in the world. We have met their strict environmental conditions as well as their toughest quality requirements. This is a sample of some of our longtime customer/partners that we continue to work with today.

These companies will only accept the highest quality products delivered on time and meeting the highest environmental standards each and every time. Projects with these companies and others include but are not limited to, road stabilization, dust control on haul roads, railcar capping, retention pond sealing, tailings dam control and much more.

We look forward to adding you to our list of quality partners.
